

LIGHT EMITTING DEVICE

Abstract of the Disclosure

5 A light emitting device has a plurality of conductive
members with good heat conductivity provided in a base
member, the conductive members are isolated by insulating
members provided between the conductive members. A light
emitting element device is mounted on the base member. An
light emitting diode is provided in the light emitting
10 device and mounted on conductive member. A projection is
outwardly projected from the heat conductive member for
cooling the LED.
